Eye health and sight loss stats and facts

Last updated: April 2018
At least half of sight loss is avoidable.
“Eye health and sight loss stats and facts” is an update on the most important messages we use about eye health, people at risk of sight loss and blind and partially sighted people.

The statements presented here can be used to support a wide range of communications. These are our evidence-based messages about the eye health needs of the nation, how many people with sight loss need support and what impact sight loss has on everyday life.

The information in this document reflects the most recent evidence. It should be used to update any older versions of these statistics or messages that are in use.

If you have any questions about how to use any of these facts or stats in your work, please contact us at stats@rnib.org.uk.

Report authors: John Slade and Emma Edwards.
At least half of sight loss is avoidable

At least half of all cases of sight loss in the UK are avoidable.

This is based on how many people are living with sight loss [1, 2]. The majority of sight loss due to refractive error can be corrected by wearing the right prescription glasses. Many forms of cataract are treatable. If detected and treated early, some sight loss due to glaucoma, AMD and diabetic retinopathy could be avoided.

16 million NHS eye tests

There are over 16 million NHS sight tests in the UK each year [3]. This figure only counts people who were eligible for and claimed a free NHS eye test, and does not include people who paid for their eye test.

Over eight million outpatient appointments

There are over eight million NHS outpatient appointments in eye clinics and ophthalmology departments in the UK each year [4].

Over 800,000 inpatient procedures

There are over 800,000 NHS inpatient procedures related to eye health in the UK each year [5].

Children’s screening

The UK National Screening Committee recommends universal vision screening for all children between the ages of 4–5 years, in school and led by orthoptists (specialists trained in children’s vision screening) [6].

Less than 1 in 3 registered blind and partially sighted people were offered mobility training, and only one in five received any practical support around the home.
Looking after your eyes

There are some important steps that we can all take to look after our eyes.

Regular eye tests

Having a regular eye examination with an optometrist is the best way to make sure that your eyes are healthy. Everyone should have their eyes examined at least once every two years - even if there is no change in your vision [7]. Yet nearly 14 million adults have not had their eyes tested in the last two years [8].

Stop smoking

Smoking can double the risk of developing age-related macular degeneration [9], the UK’s leading cause of blindness [10].

Eat healthily and watch your weight

Eating a healthy diet is good for your general health and for your eyes [11]. Obesity can increase the risk of developing diabetes [12], which in turn can cause sight loss [13].

Keep your eyes covered in the sun

Harmful rays in sunlight can damage your eyes and may increase the risk of cataracts and AMD [14, 15]. Wearing sunglasses, glasses or contact lenses with built-in UV filter will protect your eyes [16].

Safety first

DIY and sports injuries cause thousands of eye related injuries each year [17]. Always wear appropriate safety goggles to protect your eyes.
Looking after your eyes is important for everyone because sight loss can affect you whatever your age or circumstances. However, some groups of people are at greater risk of losing their sight.

Around six million people are estimated to be living with sight-threatening eye conditions in the UK today. This is based on research into how many people are living with age-related macular degeneration (AMD), glaucoma, cataract [18] and diabetic-eye disease [19, 20, 21]. It also includes figures from research into how many people are living with other eye problems, such as Drusen [18] and ocular hypertension [19], which increase the risk of preventable sight loss. Many of these people may not be affected by sight loss at this stage but could in the future. They represent the population at high risk of future sight loss.

People in later life
The older you are, the greater your risk of sight loss. There are 1.2 million people living with sight loss who are aged 75 years and over. The proportion of people living with sight loss is:

- one in nine people aged 60 years and over
- one in five people aged 75 years and over
- one in two people aged 90 years and over [1, 2].

Children and young people
There are more than 25,000 blind and partially sighted children aged 16 years and under in the UK. As many as half of these children have other disabilities [22]. Some children are at higher risk of vision impairment, including those who are very premature and very low birth weight babies [23, 24], children from the most economically deprived backgrounds [23, 24] and children with learning difficulties [25].

People on low incomes
Prevalence of sight loss is associated with having a lower income [26, 27]. Difficulty in getting to an optometrist and concerns about the cost of glasses can result in people not going for eye tests as often as they want, or delaying visits until they experience symptoms [28, 29].

People from ethnic communities
People from certain ethnic communities are at greater risk of some of the leading causes of sight loss yet many are unaware of this [30]:

- Black African and Caribbean people are four to eight times more at risk of developing certain forms of glaucoma compared to white people [31, 32].
- The risk of diabetic eye disease is around three times greater in South Asian people compared to white people [33]
- Black African and Caribbean people are also at a higher risk of diabetic eye disease [34].
People living with diabetes

There are 3.5 million people in the UK who have been diagnosed diabetes [20], and a further 500,000 people living with undiagnosed diabetes [21]. People with diabetes are at increased risk of diabetic eye disease as well as glaucoma [35] and cataracts [36].

Within 20 years of being diagnosed, nearly all people with type 1 diabetes and almost two thirds of people with type 2 diabetes will have developed some form of diabetic retinopathy [37].

People with learning disabilities

There are estimated to be more than one million adults in the UK with a learning disability [38]. Adults with learning disabilities are 10 times more likely to experience sight loss than the general population [38].

People living with dementia

Up to 850,000 people in the UK have some form of dementia [39]. Prevalence of sight loss is higher among people with dementia, especially those living in care homes [40]. It is estimated that at least 250,000 people in the UK are living with both sight loss and dementia [41].

People who smoke

There are nearly 10 million people in the UK who smoke, which is around 19 per cent of the adult population [42]. Smoking increases the risk of AMD [43]. There is also an increased risk of AMD for non-smokers exposed to passive smoking [44].

Stroke survivors

The number of people with long-standing health conditions due to a stroke is increasing. Estimates suggest that around 60 per cent of stroke survivors experience some form of visual problems immediately after their stroke, and that these problems remain for around 20 per cent of people three months after their stroke [45].
Who does sight loss affect?

More than two million people are living with sight loss

More than two million people are estimated to be living with sight loss in the UK today. This sight loss is severe enough to have a significant impact on their daily lives [1, 2].

The more than two million people living with sight loss includes:

- people who are registered blind or partially sighted
- people whose vision is better than the levels that qualify for registration
- people who are awaiting or having treatment such as eye injections, laser treatment or surgery that may improve their sight
- people whose sight loss could be improved by wearing correctly prescribed glasses or contact lenses.

Causes of sight loss

The main causes of sight loss amongst the more than two million people living with sight loss are [1]:

- Uncorrected refracted error – 39 per cent
- AMD – 23 per cent
- Cataract – 19 per cent
- Glaucoma – 7 per cent
- Diabetic eye disease – 5 per cent

Future risk

The number of people in the UK with sight loss is set to increase dramatically. It is predicted that by 2050 the number of people with sight loss in the UK will double to over four million [1, 2].

This is based on the assumption that the underlying risk factors associated with sight loss do not change and that broad demographic changes such as aging population will continue in coming decades [46].
Every day 250 people start to lose their sight

Every day 250 people start to lose their sight in the UK. This is equivalent to one person every six minutes [47].

This statistic includes AMD, glaucoma and diabetic retinopathy and some of the other causes of permanent and irreversible sight loss in the UK. Many more people will start live with sight loss as a result of uncorrected refractive error and cataract.

One in five people will live with sight loss in their lifetime

This is based on the assumption that the underlying risk factors associated with sight loss do not change. In addition, many more people will experience sight loss as a result of eye injury, cataract or refractive error.

285 million people live with sight loss worldwide

An estimated 285 million people are living with sight loss worldwide, with 39 million people who are blind and 246 million people who are partially sighted. Globally, the leading causes of sight loss are uncorrected refractive error and cataract [48].

The number of people in the UK with sight loss is set to increase dramatically.

It is predicted that by 2050 the number of people with sight loss in the UK will double to over four million.
Certification and registration

A Certificate of Vision Impairment (CVI) certifies a person as either sight impaired (partially sighted) or severely sight impaired (blind). The purpose of the CVI is to provide a formal referral route for someone with sight loss to social care services. Each CVI form is completed by a consultant ophthalmologist in an eye clinic and a copy is sent to the person’s local social services department. Upon receipt of the CVI, social services offer registration and other relevant advice and services [49].

24,000 CVIs
Over 24,000 people are given a Certificate of Vision Impairment each year in England and Wales [50].

350,000 people registered
Around 350,000 people are registered blind or partially sighted in the UK in total. Half of these people are registered blind, and half are registered partially sighted [51].

The leading causes of sight loss amongst registered blind and partially sighted people are:
- Age-related macular degeneration – 48 per cent
- Glaucoma – 16 per cent
- Cataract – 12 per cent
- Retinitis Pigmentosa – 10 per cent
- Diabetic eye disease – 8 per cent [52].

The number of people newly registered blind or partially sighted has been decreasing in recent years. In England, since 2003 we know that new registrations have decreased by 29 per cent [51].

It is important to remember that certification and registration only provide information about blind and partially sighted people who have been in some contact with health and social care services. They are a useful indication of the number of people affected by sight loss, but they do not provide the complete picture of how many people are affected by sight loss in the UK.
Cost of eye health and sight loss

£28 billion
The total estimated cost of eye health and sight loss in the UK is estimated to be around £28 billion every year [1]. This includes money spent on preventing and treating eye conditions. It also includes the indirect costs of sight loss, such as lower employment rates or the cost associated with the provision of informal care. Finally, it includes the total cost of the reduced wellbeing and health associated with living sight loss.

Further information about how the £28 billion is estimated is provided below.

£3 billion
The UK’s healthcare cost linked to eye health is estimated to be at least £3 billion every year [5]. This includes the cost of providing NHS eye examinations, prescriptions and hospital services such as outpatient appointments and inpatient procedures. This works out at over £8 million every day.

£6 billion
Indirect costs associated with sight loss cost the UK economy around £6 billion every year [5]. The highest indirect costs are lower employment rates amongst people with sight loss and the cost to family and friends of providing informal care. This works out at over £15 million every day.

£19 billion
It is estimated that the associated reduction in wellbeing and health due to sight loss totals £19 billion every year [5]. This works out at over £50 million every day.

180,000,000 informal care hours
Friends and family provide around 180 million hours of unpaid and informal care to support people living with sight loss every year in the UK [53]. This can range from things like preparing food, reading inaccessible information and help with getting out of the house [52].

Only 17% of people experiencing sight loss are offered emotional support in relation to their deteriorating vision.
While it is possible to talk about the barriers and restrictions faced by blind and partially sighted people as a whole, there are significant variations in people's circumstances and experiences. Some factors are particularly influential, such as age, amount of vision, the age at which someone experienced sight loss and whether or not someone has additional disabilities.

Some people are born with an eye condition. More commonly sight loss develops during older age. Although most people have some sight, some experience further loss of vision over time and others have no useful vision.

Children and young people
The majority of blind and partially sighted children are educated in inclusive (mainstream) education [54]. But blind and partially sighted children are increasingly being deprived of specialist support [55], and learning materials and exams are not consistently made available in alternative formats [56].

Remaining sight can change over time
For many people, even after they are registered blind or partially sighted, their remaining sight is unstable. Often people experience changes in vision over many years, and this may mean that they need to learn and relearn how to adapt to living with sight loss.

71 per cent of blind and partially sighted people have experienced deterioration in their sight over the last 12 months [52].

Lower wellbeing
Feelings of wellbeing are lower amongst blind and partially sighted people when compared to the rest of the population [65]. More than four in 10 people attending low vision clinics are suffering from symptoms of clinical depression [57].

31 per cent of blind and partially sighted people were rarely or never optimistic about the future [52].

Lack of emotional support
Being told you are losing your sight can be difficult to come to terms with, with common effects being depression, reduced wellbeing and a process similar to bereavement [58].

Only 17 per cent of people experiencing sight loss are offered emotional support in relation to their deteriorating vision [52].
Essential practical support is missing
Having to re-learn how to do everyday things is the reality of losing your sight. This can include everything from re-learning how to make a cup of tea to moving safely around your local area.

Less than one in three registered blind and partially sighted received any mobility training in the first year of experiencing sight loss, and only one in five received practical support around the home with things like preparing food or cleaning [52].

Relying on some form of support
Many blind and partially sighted people rely on some form of support or care, and often this is informal and unpaid. This support can range from tasks like preparing meals or cleaning to help with setting heating controls or help with picking out the right clothing [52].

Nearly half of blind and partially sighted people said that they always or frequently need support to read written information [52].

The proportion of blind and partially sighted people in employment has decreased

Only one in four registered blind or partially sighted people of working age is in employment [52].

Age, additional disabilities, severity of sight loss and educational attainment level are all factors that influence the employment status of blind and partially sighted people [52].

Financial struggles
Blind and partially sighted people face additional costs and expenditure as a result of their sight loss [59]. Four in 10 blind and partially sighted people of working age say that they have some or great difficulty making ends meet [52].
The number of people in the UK with sight loss is set to increase dramatically. It is predicted that by 2050 the number of people with sight loss in the UK will double to over four million.

Travel and transport remains a major issue
Four out of every 10 blind and partially sighted people were not able to make all the journeys that they wanted or needed to make [52].

Two-thirds of people of working age and one-third of people of pension age had collided with an obstacle on the pavement in the last three months [52].

Feeling isolated from the people and things around them
Four out every 10 blind and partially sighted people felt moderately or completely cut off from people and things around them [52].

Limited choice about how to spend free time
Half of blind and partially sighted people said that they were always or frequently limited in the activities that they were able to take part in. One in four people reported that they had little or no choice about how they spent their free time [52].

Poor access to key information
Nine out of ten blind and partially sighted people said that information on medication or food packaging was quite difficult or impossible to read [52].

Barriers to getting the most out of technology
There is a significant generational divide in the use of technology, with younger blind and partially sighted people much more likely to be using the internet, a computer or a smartphone compared to older people [52].

Overall, less than one in three blind and partially sighted people feel able to make the most of new technology [52].
Public awareness and attitudes towards sight loss is poor

Nearly half of blind and partially sighted people of working age said they had been treated unfairly by others in the last 12 months due to their sight loss [52].

Sight loss is the biggest barrier people face

When people are asked to talk about the reasons why they experience difficulty or restrictions, whether in relation to travel, employment, technology, or leisure, by far the most common reason given is their sight loss. Many people, including those with a range of other challenges and impairments, consider sight loss as the major factor in stopping them from doing all the things they would like to do in life [52].

Sight loss affects people of all ages. As we get older we are increasingly likely to experience sight loss.
State of the Nation: Eye Health 2017 provides the latest evidence on eye health across the UK. It supports strategic thinking to transform eye health and take steps to stop people losing their sight unnecessarily.

My Voice
Research into the views and experiences of over 1,200 registered blind and partially sighted people in the UK. My Voice covers a range of different topics, such as employment, transport and access to information and services. It is a key source in helping us understand the circumstances of blind and partially sighted people.

Sight Loss Data Tool
Sight Loss Data Tool is the UK’s biggest collection of eye health datasets. The Excel based tool shows users all of the local figures relating to sight loss and eye health to use as evidence in campaigns, fundraising and service development.

Evidence-based reviews
RNIB’s Evidence-based reviews look in detail at the experiences of blind and partially sighted people in different age groups. They include a profile of the group, the policies that govern and impact upon their lives, and a commentary on what the evidence tells us. We publish reviews focusing on children and young people, people of working age and older people.
Information on the latest research news and reports published by RNIB, as well as guides to impact measurement, blogs and other resources.

All of these resources can be accessed on the RNIB website: rnib.org.uk/research

Eye health and sight loss stats and facts is an annual update on the most important messages we use about eye health, people at risk of sight loss and blind and partially sighted people.

The report is available to download from: rnib.org.uk/stats
